AutoCAD Architecture - GUI AutoCAD Architecture is a software development toolkit that was designed to create user interfaces that work equally well for screen readers, and sighted users. This development model has been widely adopted for many other UI development projects. AutoCAD Architecture AutoCAD Architecture lets users develop web-enabled apps with a single, unique source code file. This means one code base for mobile, tablet, and desktop interfaces. AutoCAD Architecture - API AutoCAD Architecture gives developers access to AutoCAD on the web, desktop, and mobile devices through their web browser or Windows Runtime apps. To make use of the AutoCAD API, developers would create web apps using.NET Framework APIs, and then embed the web app in a Windows Runtime App. AutoCAD Architecture - Browser Extension AutoCAD Architecture can be used to build native browser extensions for the desktop version of AutoCAD. These extensions are called apps within the AutoCAD Web App platform. AutoCAD Architecture is built on MVC (Model-View-Controller) pattern. As mentioned above, MVC apps are called apps in AutoCAD Web App platform. Multi-Views One of the features of AutoCAD Architecture is that it can work with multiple views. For example, there are three views in AutoCAD: the "Design" view, "Status" view. There are many more, but it is much easier to explain how this feature works when we are dealing with only three views. Multi-views in AutoCAD Architecture In the "Design" view, you can see any one view from any layers. In the "Reference" view, you can see any one view from any layers. We can make three views and make the "Status" view to appear in the "Design" view, or both. So, we need to do the following to switch views. Open the App.xaml.cs file and set the InitialView property, e.g. InitialView = View.Design; InitialView = View.
