Usually, a color profile is a device-specific color setting that corresponds to the color that is "best" for a given device. A device-specific profile is typically called an ICC profile. A color profile allows a color-managed application like Photoshop to calculate what colors look like on various devices. If you are not sure whether or not you are using a color profile, you can use the "Color Settings" dialog to choose Figure–8, No Profile, or Figure–8, Sample Input. Figure–8, Sample Input, will open the Color Settings dialog, which asks you to provide a name for the profile and then allows you to select one or more profiles to compare. Make sure the "Show None" check box is not checked, and you should see a list of your profiles loaded and waiting. Photoshop does, however, support other types of color profiles besides ICC. In addition to ICC, you can use sRGB, which consists of a subset of the primaries for Photoshop, and sRGB (linear), which is one of the few other profiles Adobe supports.
