Mean The statistical result is the arithmetic mean of a set of observations. formula where and are the number of observations in the set and is the central tendency, the mean of the observations. table The table contains the results of the measurement or counting operation. The mean of the measurement is the result of the application of the formula to the observations. mean The mean is not a measurement of central tendency, it is the mean of the measurements. hypothesis The hypothesis is the assumption of which the mean is to be calculated. Often the mean of a normal distribution is used as a reference. standard deviation The standard deviation is the measure of how far an observation is from the mean. trim A trim (also called trimming or clip) is the trimming of an observation or of the data set from which an observation is drawn. skew Skew is a measurement of the variation of a distribution. If the distribution is not symmetrical, then the skew is measured as positive or negative. significant Significant is the probability that a result (observation) is not due to the normal or random distribution of observations. summary measures Summary measures are used to describe a whole distribution at once. box plot box plot shows the distribution of the measurements within a set of boxes with the mean value displayed at the top of the box, the lowest observation at the left side of the box, the highest observation at the right side of the box and the center marking the median of the observations. Box-plots visualize the distribution of data, or the central tendency and variation of the measurements. histogram A histogram is a bar chart containing a vertical axis and a horizontal axis. The vertical axis shows the number of observations with a certain value on the horizontal axis. A histogram is therefore also a bar chart, but all bars have the same height. Bivariate data A bivariate data (also bivariate data set) is a data set with two components, which are typically displayed as two plots on the same graph. The two components are often visualized by different graph types. The most common way is to plot the two components on the same axis. triangle plot A triangle plot is a diagram of a single triangle, which is typically used to
